Google Play Store (Image credit: Android Central) Google seems to want to move away from Android app formatted as APKs in the Play Store. It's now started mandating that new apps entering the store from August should use its new AAB format. The move is likely to harm third-party app stores as Google remains the only store that uses the AAB format. Google this week announced that it would be mandating the adoption of the Android App Bundle (AAB) over Android Packages (APKs) for new apps submitted from August 2021. The company had previously introduced the Android App Bundle as a new way of formatting apps for publication to the Play Store in 2018. It had seen adoption from developers as high-profile as Netflix and Adobe. Android App Bundles offered benefits for users in the form of smaller downloads. To put it simply, an APK install would have to be compatible with all supported device configurations and languages, while an AAB-packaged app would download only what was needed for your device and language combination. For developers, Google pitches them as more efficient and resulting in fewer uninstalls from users. They are also more secure via Google's Play App Signing, preventing apps from being compromised. While developers had the option to choose between APKs and AABs in the past, new apps submitted to the Play Store won't have that option anymore. Existing apps are exempt, though the use of the word "currently" means that Google is likely to change this requirement in the future. As always, the issue for developers is that if they want to target the Amazon App Store for Fire tablets and Windows 11 PCs, Huawei's AppGallery for HarmonyOS, and the Google Play Store, they'll have to have completely separate code bases for each platform, and only Google's benefits from these changes. Developers already face hurdles because each app store has its own set of common APIs, and this may cause even more friction that may discourage some from supporting third-party app stores. In this week's Roundup we look at the release of Chrome for Mac and Linux and its support for extensions, a security flaw in Safari, popularity of SaaS and more. Mac and Linux users are expected to get Chrome by the first half of this year. Google has also added support for extensions in the latest release of the popular browser — 2.0.156.1. In the world of security, a flaw related to RSS feeds was found in Safari that could allow malicious websites access to the user's files. Google Code has also fallen victim to malware according to a security researcher. Yahoo appointed a new CEO this week, Carol Bartz from Autodesk, while Steve Jobs steps down from his role as CEO at Apple due to illness. The popularity of SaaS is expected to grow in 2009, a survey revealed with more than half of developers around the globe planning to take advantage of the model this year. Facebook is extending its Facebook Markup Language (FBML) to permit the creation of custom tags, but some argue the social networking site should also consider releasing the mark-up code to developers to make it more useful. In tech articles this week, we give you 10 predictions for Linux and open source in 2009, two factors to consider when implementing multithreading in .NET, and an analyst claims that service-oriented architecture (SOA) is dead as of 1st of January. If you haven't downloaded the Windows 7 beta yet, take a look at the new and improved Taskbar in more detail. — Posted by Lana Kovacevic Allow Chrome to install unknown apps by going to Settings > Apps > Menu > Special access > Install unknown apps. Install a file manager (such as Cx File Explorer or File Manager) so that you can find the APK file after you download it to your phone. Download an APK file and open it to install it. Alternatively, transfer the APK Installer from your computer using USB. If you want to use an app from outside of the Google Play Store, you can install the app's APK file. This article explains how to install APKs on Android 7 or later. Before you can download APK files using Chrome or any other browser, you must first allow unknown apps: Go to your device settings and tap Apps & Notifications (or Apps in older versions of Android). Tap the three dots in the upper-right corner. Tap Special access. Tap Install unknown apps. Tap Chrome (or whichever web browser you use) Move Allow from this source to the On position. Now that you've configured your phone to let you install unknown apps, you'll need a way to find the application file (APK file) on your phone so that you can run it. Android phones typically come with a file manager app you can use, but if you don't have one, search for one of the best Android file managers on Google Play. For example, you can download Cx File Explorer or get File Manager. The easiest way to install an APK file on your Android is to download the file using the default browser, Chrome. Find a website offering the Android app and tap the link to download the APK file. Accept any pop-ups, including "This type of file can harm your device." Only download APK files from reputable sources. A quick Google search can often let you know if an app (or company that makes the app) has a questionable reputation. If your phone's web browser doesn't give you the option to open the file after downloading, open your file explorer app, go to the Downloads folder on your device, then tap the APK file. Allow the app any required permissions it asks for. Then, at the bottom of the installer window, tap Install. Now you'll see the app available in your list of installed apps. If you don't have internet access on your phone, or for any other reason you can't use a browser to download the file, you can still install apps from your computer. Using your computer web browser, download the APK file just like described above. Once it's downloaded, connect to your Android phone and transfer the file. If you've never connected your Android to your computer, turn on USB debugging mode on Android. You can then plug your phone into your computer with a USB cable, and it'll mount the phone like it would a memory stick. Once your phone is connected to your computer, it shows up as another drive in your computer's File Explorer. Move the APK file you downloaded from the app website to the /sdcard/download folder on your phone. Once the file is transferred, use the file explorer app on your phone as described in the previous section to tap the APK file and install the app. If you don't have a USB cable, another solution is to install WiFi FTP Server from Google Play. Then, use a free FTP client software program on your computer (for example, download FileZilla), to transfer the APK file from your computer to the /sdcard/download folder on your phone. However, this is an advanced option and requires an understanding of how to use FTP files. If the APK installer isn't running when you tap it, there's an advanced solution that might work. You can install the APK file on your Android from your computer using a tool called Minimal ADB and Fastboot. Connect your phone via USB and enable USB Debugging. Download Minimal ADB and Fastboot on your computer, and then install it. Run the tool, and a command window opens. With your phone connected to your computer with the USB cable, type the command adb devices. If the tool detects your phone, an ID for the device appears under List of devices attached. Now you're ready to transfer the APK file. Using Windows File Explorer, find the downloaded APK file on your computer. Right-click the file and select Copy. Using Windows File Explorer, navigate to the Minimal ADB and Fastboot folder (typically c:\Program Files (x86)\Minimal ADB and Fastboot). Paste the APK file into that folder. Rename the APK file to something short so that it's easy to type as a command. Back in the same command window you had open before, type the command adb install app name (replace with the name of your APK file). When you see the word Success, the app is installed on your phone. An APK (Android Package Kit) is a type of file that installs an application for Android. It's just like an executable (EXE) file for Windows or a package installer (PKG) for Mac. If you've ever installed an Android application from the Google Play store, then you've used an APK file without realizing it. When you tap the Install button, Google Play automates the process of transferring the APK file to your phone and running it for you. If the Android app you want to install isn't available on Google Play, you can download the APK file from the web and install it manually. There are many websites where you can find non-Google Play apps to install. For example, visit Apk Pure, Reddit's Apk Directory, or APKMirror. FAQ Can APK files harm your Android? Possibly. Any file you download online can contain a virus, which is why it's important to only download APKs from safe sources. Can I delete APK files on my Android? Yes. APK files are only used to install apps, so once the app is installed, you can delete the APK. What is ConfigAPK on Android? ConfigAPK comes preloaded on Android devices. It's used to run APK files and install apps. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! Ever find yourself browsing the Chrome Web Store while you're out, and then you stumble upon a really awesome extension or app, and wish desperately that you could install it right that minute to your idling home computer? It may have once been the stuff of dreams and science fiction, but on Thursday, Google introduced a new Web Store feature that accomplishes exactly that: a button which installs extensions to the desktop or laptop Chrome installation of your choice. It's simple, in theory. As Android Police uncovered, when you visit an extension's Web Store page on your phone, you're presented with two options: sharing it with a friend via e-mail or social media, or "adding it to your desktop." If you opt for the latter option, an informative pop-up will alert you to the fact that the extension in question will be installed "[to] any computers where you are signed in to Chrome." Dismiss it, and the extensions will automatically begin downloading on any Windows, Mac, Chrome OS, or Linux machine on which you've configured — and associated your account with — Chrome. The feature is not unlike Google's remote app installation for Android. Users of Google's mobile operating system have the ability to install apps and games from the Web to a signed-in Android smartphone or tablet. But remote Chrome app installations, unlike the Play Store feature, appear to lack any sort of management capabilities beyond simple installation. In 2012, Google introduced a "My Android Apps" software management section to the Play Store (which has since become outmoded), that allowed the remote uninstallation of apps on Android devices. Remote Chrome extension installations are relatively painless right now, but are also clunky. There's no way to trigger remote installations to individual machines rather than to every instance of Chrome to which you're signed in. And worse, there's no way to browse the Chrome Web Store from a mobile device — as of publication time, you get an error message suggesting you use a "supported" operating system such as Windows, Mac, Chrome OS, or Linux. But it's early days. The new feature might be perceived as another step toward a long-rumored merger of Chrome OS and Android. Earlier this year, in May, Google rolled out the Play Store on Chrome OS devices — an addition which saw Chromebooks gain the ability to install and run Android apps. That's no accident. Last year, Google CEO Sundar Pichai named Hiroshi Lockheimer senior vice president of Android, Chrome OS, and Chromecast. And in 2015, the Wall Street Journal reported that Google had been working for years to merge Chrome OS and Android, and that it planned to launch the result — a new, unified operating system that worked on PCs — in 2017.
