```

All properties must be prefixed with jmeter.reportgenerator. Attribute Description Required report title Title used in the generated report. Default: "Apache JMeter Dashboard" No date_format No start_date Start date of the range of data to use for report. Date format is defined by date_format property. Default: not filled which means data range will be used from the beginning No end_date End date of the range of data to use for report. Date format is defined by date_format property. Default: not filled which means data range will be used until the end No overall_granularity No apdex_satisfied_threshold Sets the satisfaction threshold for the APDEX calculation (in ms). Default: 500 No apdex_tolerated_threshold Sets the tolerance threshold for the APDEX calculation (in ms). Default: 1500 No jmeter.reportgenerator.apdex_per_transaction Sets satisfaction and tolerance threshold to specific samples. Use sample names or regular expression. Format is sample_name:satisfaction[|tolerance:] Values are in milliseconds. Notice the colon between sample name and values, the pipe between thresholds and the semicolon at the end to separate different samples. Don't forget to escape after semicolon to span multiple lines. Example: jmeter.reportgenerator.apdex_per_transaction=sample(\d+):1000|2000|samples12:3000|4000|scenar01-12:5000|6000 No sample_filter Sets the filter of samples to keep for generating graphs and statistics. An empty value deactivates the filtering. Format: Regular expression. Default: "" No temp_dir Sets the temporary directory used by the generation process if it needs file I/O operations. Default: temp No statistic_window Sets the size of the sliding window used by percentile evaluation. Caution: higher value provides a better accuracy but needs more memory. Default: 20000 No Percentiles used by Summary table and Percentile graphs can be adjusted to different values by using the 3 properties: aggregate_rpt_pct1: Defaults to 90 aggregate_rpt_pct2: Defaults to 95 aggregate_rpt_pct3: Defaults to 99 Relative paths are built from the JMeter working directory (default: bin). You can define some overall properties which are used by the generator configuration. These properties are freely named but you should use the prefix jmeter.reportgenerator. in order to avoid property overlap. E.g.: Property definition: jmeter.reportgenerator.overall_granularity=60000 Property reference: \${jmeter.reportgenerator.overall_granularity} The calculated percentiles might differ from those from the Aggregate Report in the GUI. This is because the dashboard uses a different formula to estimate the percentiles. It will be most observable when the distribution of the timing values is spread too wide. That can happen if too few samples were taken. If you want the numbers to be more or less the same as those from the Aggregate Report, you will have to switch the used estimator from LEGACY to R_3, by specifying the JMeter property backend_metrics_percentile_estimator=R_3 (this time without any prefix). See the report in the attachment [aggregate.csv]. However, the Aggregate Report GUI shows 50%, 75%, and 90%, which is from my configuration in jmeter.properties. See the file and screenshots in the attachments [jmeter.properties] [aggregate-report-gui.png]# Percentiles to display in reports# Can be float value between 0 and 100# First percentile to display, defaults to 50%aggregate_rpt_pct1=50# Second percentile to display, defaults to 75%aggregate_rpt_pct2=75# Third percentile to display, defaults to 90%aggregate_rpt_pct3=90Could you tell me if it is possible to make the plugin to read Percentile configuration in jmeter.properties?unread, Aug 31, 2018, 1:10:06 PM8/31/18Sign in to reply to authorSign in to report message as abuseEither email addresses are anonymous for this group or you need the view member email addresses permission to view the original messageHTThanks for your report. The problem should be fixed in the Synthesis Report plugin version 2.2Artemвторник, 21 августа 2018 г., 11:18:39 UTC+3 пользователь Buaban Buaitoitom napisa: For the jtl file generated by the jmeter test, in addition to using the jmeter plug-in to generate csv or results, you can also directly use the aggregate report to open it. Here is how to operate. 1. Generate jtl file Note that by default, the aggregate report plugin can only analyze the jtl file generated by the aggregate report. The jtl file generated by the command line -l parameter will be missing two columns, as shown in the figure: View Image You can also modify the configuration of jmeter, and then generate the jtl file through the -l parameter, and enable the relevant configuration in jmeter.properties, as shown below jmeter.save.saveservice.thread_counts=true Just remove the gaze from this line. 2. Analyze the jtl file It's very simple. Use the browse in the aggregation plugin to open the target jtl file. Look at the figure below and get the analysis result. View Image We need to focus on the following columns: average: average response time 90% Line: 90% response time, 95%, 99% and so on Throughput: Tps Reprinted at: We know below command generate jtl file. jmeter -n -t test.jmx -l testresults.jtl Is there any way to generate aggregate report in csv format as output of above command line? JMeter is an open source, JAVA based tool designed to load test web applications and measure performance. At logos, we also use it to benchmark our development environments. JMeter provides a GUI to setup and run the test-plans. It displays the output in tables, graphs etc. But, the GUI mode should only be used to setup the test-plans and the actual tests should be performed from the command-line. Directly quoting from JMeter docs: GUI mode should only be used for creating the test script. NON GUI mode must be used for load testing/Running JMeter from the command-lineThis also allows one to automate the load tests. To run tests from the command-lineWhere jmeter-dir refers to directory that is created when you extract/unpack the JMeter binaries during installation.And to generate the output in CSV format: Looks simple and done until one opens the ~1MB output.csv to see details of every single request that was sent. Lot of data. Yet, not much useful. We want the crunched numbers. We want the Aggregate Report. So all that's required is another argument which tells jmeter to generate the aggregate report? Nope. JMeter, when run from the command-line, seems a bit limited when compared to GUI mode. Since, what it can do, just by adding the correct listeners in GUI mode, requires us to install some extra plugins for the non-GUI mode to do the same. Generating JMeter Aggregate Report from the command-lineTo do this we need to install 2 plugins: JMeterPluginsCMD Command Line ToolSynthesis ReportThe easiest way to install these plugins is using the JMeter Plugins Manager. Procedure to setup up the plugins manager and installing the plugins can be found on the JMeter website. After installing both plugins use the command: As you can see this uses the jtl files produced from running JMeter on our test plans in the first command of this post. In the above method, to install the plugins manager and the individual plugins, we had to use the GUI mode. What if, all we have is the command-line? What if we don't want to touch the GUI after generating our test plans? Installing JMeter plugins using the command-lineThese situations might arrive when you are testing remotely and any sort of UI interaction is not possible. Installing plugins from command line is rather simple once you've installed the Plugins Manager. So, for a moment assuming that you've setup the plugins manager, this is how we can install the plugins: Here, the jpcg-cmd and jpcg-synthesis are called plugin ids. You can find these by typing the plugin name in search bar at the plugins home page. Moving on to the last part of the puzzle. Installing JMeter Plugins Manager from the command-lineThis can be done in 3 simple steps: Download the cmdrunner-x.jar from here, and place it in [jmeter-dir]/lib. Download the jmeter-plugins-manager-x.xx.jar from here, and place it in [jmeter-dir]/lib/ext. x denotes, just, the version number of the jars and nothing more. Run the following command to generate the plugins manager script: java -cp [jmeter-dir]/lib/ext/jmeter-plugins-manager-0.xx.jar org.jmeterplugins.repository.PluginManagerCMDInstallerPut x according to version that was downloaded from the links. Now you have generated the PluginsManagerCMD.sh in the [jmeter-dir]/bin directory and could use it to install the plugins as shown above. But you said only command-line is available! Why are we manually downloading files and placing inside jmeter dirs? Automating the automatic! The official JMeter documentation, if you can find it, calls it as "preparation" If you want to use JMeter Plugins Manager in an automated fashion, you will need to make some preparations first! But in the end these are just 2 jar files that you can fetch and move using simple unix commands. It is advisable to simply put them in a separate directory and be sent along with the test plans. Going one step further, all this could be done in one bash script which could be executed on the remote machine before running the test plans. Looks a little crude, but it works.
